# GENERAL CONSIDERATIONS

CTEPH is a two-cause disease

- Mechanical obstruction → PEA and/or BPA are the therapeutic options
- Microvascular disease → specific medical therapy (Riociguat & Treprostinil plus Bosentan by 648)

# EVALUATION PROCESS

## DIFFERENT STEPS

- PEA's assessment
- Specific medical therapy
- BPA's assessment

# REFERENCE

## **Terapia chirurgica dell'ipertensione polmonare cronica tromboembolica mediante endoarteriectomia polmonare**

Andrea Maria D'Armini, Giorgio Zanotti, Matteo Pozzi, Salvatore Nicolardi, Corrado Tramontin, Vito G. Ruggieri, Marco Morsolini, Fabrizio Tancredi, Cristian Monterosso, Mario Viganò, a nome del Pavia Pulmonary Endarterectomy Study Group (vedi Appendice)

*Cattedra e Divisione di Cardiochirurgia, Università degli Studi di Pavia, IRCCS Policlinico San Matteo, Pavia*

(G Ital Cardiol 2006; 7 (7): 454-463)

# REFERENCE

**Tabella 2.** Esami diagnostici di primo livello.

Test diagnostico	Razionale	Quadro tipico
ECG	Evidenziare dilatazione/sovraccarico ventricolare	Precoce: solitamente normale Tardivo: segni di dilatazione/ipertrofia VD e dilatazione AD
Rx torace	Visualizzare l'ombra cardiaca e gli ambiti polmonari (parenchimale/vascolare)	Precoce: solitamente normale Tardivo: area avascolare, dilatazione dell'arteria polmonare, trama vascolare irregolare (aumentato flusso bronchiale) e asimmetrica, esiti cicatriziali pleurici
Ecocardiogramma	Stimare le pressioni arteriose polmonari, valutare anatomia e funzione delle principali strutture cardiache, ricercare la presenza di shunt intracardiaci	Dilatazione/disfunzione delle camere cardiache destre, insufficienza tricuspide destra, aumento delle pressioni polmonari, movimento paradossale del SIV, disfunzione VS, possibile comunicazione interatriale (FOP)

AD = atrio destro; ECG = elettrocardiogramma; FOP = forame ovale pervio; Rx = radiografia; SIV = setto interventricolare; VD = ventricolo destro; VS = ventricolo sinistro.

(G Ital Cardiol 2006; 7 (7): 454-463)

# REFERENCE

**Tabella 3.** Esami diagnostici di secondo livello.

Test diagnostico	Razionale	Quadro tipico
Scintigrafia V/P	Diagnosi differenziale IPCTE vs IPI	Uno o più segmenti polmonari con "mismatch" ventilo-perfusorio
Cateterismo cardiaco destro	Misurare le pressioni in AP e IC, calcolare le RVP	Pressioni polmonari prossime a valori sistemici o sovrasistemiche, IC < 2.0 l/min/m <sup>2</sup> e RVP notevolmente elevate (spesso > 1000 dynes*s*cm <sup>-5</sup> )
PFR/EGA	Escludere/valutare cause parenchimali di IP, valutare la funzione respiratoria	Non anomalie significative/lieve quadro restrittivo (dovuto a precedenti infarti polmonari), ipossiemia, alcalosi respiratoria compensatoria, ridotta DL <sub>co</sub>

AP = arteria polmonare; DL<sub>co</sub> = capacità polmonare di diffusione per il monossido di carbonio; EGA = emogasanalisi; IC = indice cardiaco; IP = ipertensione polmonare; IPCTE = ipertensione polmonare cronica tromboembolica; IPI = ipertensione polmonare idiopatica; PFR = prove di funzionalità respiratoria; RVP = resistenze vascolari polmonari; V/P = ventilo-perfusoria.

(G Ital Cardiol 2006; 7 (7): 454-463)

# REFERENCE

**Tabella 4.** Esami diagnostici di terzo livello.

Test diagnostico	Razionale	Quadro tipico
Angiografia polmonare	Valutare l'anatomia arteriosa polmonare, l'estensione/localizzazione degli emboli cronici (per porre diagnosi, valutare l'eleggibilità all'intervento e prevedere l'outcome operatorio)	Irregolarità intimali, difetti "a tasca", bande o "reti" intravascolari, riduzione repentina del calibro vascolare o amputazione dello stesso
TC torace	Fase vascolare: identica a quella angiografica  Fase parenchimale/mediastinica: valutare il parenchima polmonare, escludere cause estrinseche di IP	Quadro vascolare: identico a quello angiografico Quadro parenchimale: perfusione a mosaico ed esiti cicatriziali subpleurici Quadro mediastinico: dilatazione delle arterie bronchiali

IP = ipertensione polmonare; TC = tomografia computerizzata.

(G Ital Cardiol 2006; 7 (7): 454-463)

# BACKGROUND

In patients with CTEPH undergoing PEA it is important to minimize residual obstructions, in order to achieve low postoperative pulmonary vascular resistances and better clinical results

# METHODS

In 564 consecutive CTEPH pts undergoing PEA the count of the number of treated branches was performed directly on the surgical specimens

Post-operative FUP visits were scheduled at 3 months and 12 months after surgery including right heart catheterization and modified Bruce test

# ANALYSIS OF PEA SPECIMEN

Surgical specimen of a patient with a Jamieson 1 disease. A total of 32 branches were treated in the right lung and 29 in the left lung. The arrows indicate how 5 treated branches were counted in the middle lobe of the right lung  
S= superior lobe, M = middle lobe, I = inferior lobe, L = lingula

# POPULATION

The population was divided into tertiles based on the number of treated branches

Group 1	from 4 to 30 treated branches	194 patients
Group 2	from 31 to 43 treated branches	190 patients
Group 3	from 44 to 100 treated branches	180 patients

# MPAP AT 3 AND 12 MONTHS AFTER PEA

ANNALS OF CARDIOTHORACIC SURGERY

# **SURGICAL PROTOCOL**

## ***TAILORED AND LESS INVASIVE SURGERY***

Since 15-10-2009 (#245)

	<b>Original San Diego protocol</b>	<b>Actual Pavia protocol</b>
Aortic clamp	Yes	No
Cardioplegia	Yes	No
Hypothermia	Deep (18°C)	Moderate (24°C)
Circulatory arrest	A single (20 minutes) period of circulatory arrest for each side (with a maximum of a third)	Intermittent short periods of circulatory arrest ( $\approx$ 7-10 minutes) followed by short re-perfusion periods ( $\approx$ 5-7 minutes)
Total arrest time	Maximum 60 minutes	Maximum 180 minutes

# SURGICAL PROTOCOL

*Up today more than 1100 PEAs were performed with this technique*

# CONCLUSIONS

In our hands a longer total circulatory arrest time (average 95 minutes) allows the surgeon to explore all the pulmonary vascular bed, find unexpected chronic thromboembolic material and clean more branches (average 45) even in more complex clinical conditions as well as in distal vassels

# NEUROPSYCHOLOGICAL OUTCOMES

# NEUROPSYCHOLOGICAL OUTCOMES

The main findings of our study show that repeated short periods of MHCA during PEA in patients with CTEPH did not result in any neuropsychological complications

More remarkably, we found a statistically significant postsurgical improvement in motor speed, which was accompanied by a better quality of life and reduced symptoms of depression and anxiety

# CASE REPORT

## PEA IN CATHETER-INDUCED CTEPH PATIENT

- At 6-month FUP we already have WHO functional class I, normalization of pO<sub>2</sub> (stop O<sub>2</sub>-therapy), adequate 6mwt distance and normal hemodynamic data → *no need to consider BPA on the left lung*
- At 2-year FUP we confirm WHO functional class I, normalization of pO<sub>2</sub>, adequate 6mwt distance (490 m) and normal hemodynamic data
